

RAISED ACCESS FLOORS

Glumac has extensive experience in the design of raised access floor HVAC and electrical systems. We are strong advocates of its use due to the versatility and flexibility it affords. It is designed to respond to the continuous need for change required by technological innovations in the workplace. It is also a useful product in surroundings that have a high concentration of production facilities.

High-rise office developments and data centers are the main markets for raised access floors. The system provides ease of installation of cables and connections of every type and is a practical and cost-effective application for rapid and efficient maintenance operations. It is installed without the need for masonry work and reduces the amount of time necessary to reposition offices and technical equipment.
